

AGPL network use

The GNU Affero General Public License addresses software used through a network service. When users interact remotely with a modified AGPL-covered program, those users must be offered the corresponding source code even if no executable copy is downloaded to them.

MPL and GPL compatibility

MPL 1.1 and GPL 2.0 requirements can conflict when covered modules are combined into one program. MPL 2.0 added a secondary-license mechanism that can permit distribution of a larger work under GPL 2.0, LGPL 2.1, or AGPL 3.0 terms when its conditions are satisfied.

Hybrid notices

A centralized notice alone can make the origin of individually reused files unclear. The hybrid notice approach places an appropriate notice in each file and also maintains a project-level notice, preserving attribution when only selected modules or files are reused.
